To Whom It May Concern,

Subject: Professional Feedback — Gujarati Dastavej AI Valuator

I am Harsh Kathrani, Technical Manager at Dot Value Consultancy and a Civil Engineer (B.E., Gujarat Technological University). I currently worked as an Assistant Valuer handling market valuation assignment across the Saurashtra and Kutch region, and continue to work with Gujarati property documents, including Dastavej (Sale Deed), Property Card, and Village Form No. 2, in the course of my practice.

Devansh Ganatra shared an early working version of the Gujarati Dastavej AI Valuator with me for review. I tested it against sample documents from my own reference material. In this initial test, the tool correctly identified the general structure of the documents, but the owner's name, the four-side boundary details, and the area and city fields were not extracted accurately and required correction. I shared this feedback directly, and the subsequent version I was shown had addressed these specific issues.

I also discussed the property valuation methodology with him — specifically, two standard approaches used in practice: a composite rate method, where value is calculated as land area multiplied by rate; and a land-and-building method, where land value (area × rate) and built-up construction value are calculated separately and added together for the total property value. I understand both methods were incorporated into the tool's valuation calculation as I described them.

My review and the comments in this letter are limited to the document types and valuation methods described above, which fall within a Civil Engineer's professional domain. Land records or valuation matters that fall under a different technical or regulatory authority are outside the scope of my professional practice, and this letter should not be read as an opinion on those.

In my professional opinion, this tool addresses a genuine and everyday burden in how Gujarati property documents are currently processed — manual reading and transcription of semi-legible, regional-language documents is slow and error-prone in practice. What I have seen shows real promise as a productivity aid for valuers and lending institutions. I would recommend further testing across a larger and more varied set of real documents before it is relied upon in a live lending or legal workflow, and I would continue to treat its output as a preliminary draft for a certified valuer's review rather than a substitute for one.

Sincerely,

Harsh Kathrani

Technical Manager, Dot Value Consultancy
